

OCTOBER MONTH WHEAT FORECAST, 1926-27.

TOTAL 37,100,000 BUSHELS, AVERAGING 14.00 BUSHELS PER ACRE.

Area. The estimated area under crop is based mainly upon direct returns received from farmers and should be reasonably accurate.

2,965,000 (2,735,000) acres were sown with wheat, increase 230,000 acres. For grain 2,650,000 (2,466,000) acres, increase 184,000 acres, the balance, 315,000 acres, for hay. The grain area is still considerably less than the maximum year 1916-17 - 2,778,357 acres.

Yield. General Reports covering practically all the wheat areas of the State were obtained from local Police Officers, who informed themselves by personal observations and enquiry as to the seasonal conditions and the prospects based upon the outlook for October month. These reports, aided by office records of district rainfall and wheat averages of previous years, provided the material for the estimate. With very few exceptions, the general outlook was reported to be most satisfactory in all the Divisions of the State.

On the basis of the October outlook, the probable yield is estimated to be 37,100,000 Bushels averaging 14.00 Bushels per acre. It should be noted that if the remainder of the season continues ideal, this estimate may be exceeded. On the other hand, should November weather conditions become unfavorable, it may be reduced. In any circumstances, however, a bountiful harvest is practically assured.

AREA SOWN FOR GRAIN.

DIVISION	Estimated 1926-27 Acres	Actual 1925-26 Acres	Mean 5 years to 1925-26 Acres	Max. Year 1916-17 Acres
I. Central	473,000	463,709	480,731	605,564
